TIER X CLAN BATTLES

Competitive Research & Winning Team Strategy

An organized field guide to team composition, match execution, and choosing between an offensive push and defensive hold.

QUICK BRIEF

The central principle

Build a seven-ship lineup around **vision, overlapping radar, crossfires, objective control, and coordinated target elimination**—not simply around ships with high damage or win rates.

- **Choose roles before ships.** Every pick should solve a team problem.
- **Turn information into damage.** Spotting and radar matter most when allied guns are ready.
- **Create multiple firing angles.** Force opponents to turn broadside or give up space.
- **Protect the team's ability to disengage.** A failed push needs an exit route.
- **Replace jobs, not just hulls.** If a ship is banned, deliberately cover the role it supplied.
- **Do not confuse aggression with rushing.** Commit when the team has support, a favorable local fight, and a manageable enemy crossfire.

Two different levels of strategy

> ***General strategy at the beginning:*** *the team's baseline operating system—how to scout, control caps, coordinate radar and focus fire, position in the midgame, and make endgame decisions. It applies regardless of whether the team eventually pushes or holds.*
>
> ***Push-versus-hold comparison at the end:*** *a specific strategic choice between two win conditions.* ***Push*** *spends health and takes territory when a local advantage makes a decisive fight favorable.* ***Hold*** *preserves ships, defends owned caps, resets enemy captures, and lets points and positioning force the opponent to act.*

The two sections complement each other: use the general principles in every battle, then choose the push or hold plan that fits the map, score, enemy setup, and available roster.

PART I — GENERAL TEAM STRATEGY

1. Recommended baseline lineup

The original recommended composition is built to combine forward information, layered radar, close-range control, sustained damage, and mobile crossfire. It is a starting point—not a fixed lineup for every map or season.

Ship roles

- **Ohio — Battleship anchor**

  - **Job:** central fire support, punish broadside targets, support a controlled push, and finish low-health enemies.

  - Keep Ohio positioned to threaten more than one lane instead of committing immediately to a single flank.

  - Make opponents pay when they maneuver under friendly radar and crossfire.

- **Gdańsk — Forward control and radar pressure**

  - **Job:** contest approaches, threaten enemy destroyers, provide forward information, and create short radar windows for concentrated fire.

  - Pressure the enemy's ability to operate near a cap; do not rush into the cap simply to trade away its health.

- **Daring — Cap control**

  - **Job:** spot, contest capture points, use smoke and hydro defensively, and threaten close-range destroyer engagements.

  - Complements Gdańsk by helping secure an objective while Gdańsk applies radar pressure or shifts to another angle.

  - Save smoke when it may be needed to survive a counter-push.

- **Petropavlovsk (Petro) — Radar anchor**

  - **Job:** support the contested cap with radar, punish cruisers with AP, and hold a position from which allies can shoot revealed targets.

  - Call the target before activating its relatively brief radar.

  - A revealed enemy near an objective should face several allied guns, not Petro alone.

- **Napoli — Close-range support**

  - **Job:** support a controlled advance, pressure enemy cruisers, and exploit openings when the enemy's defensive position weakens.

  - Its durability and exhaust smoke make it useful for planned close-range engagements or repositioning.

  - Its presence should make an enemy hesitate before retaking an objective.

- **Venezia — Mobile crossfire**

  - **Job:** create a second firing angle, punish exposed ships with SAP, kite under focus, and disengage using mobility and exhaust smoke.

  - Find an angle that makes enemy cruisers turn broadside to Ohio, Petro, or Hindenburg.

  - Prevent the team from becoming a predictable line firing from one direction.

- **Hindenburg — Sustained damage and kiting**

  - **Job:** maintain dependable damage at range, protect the withdrawal route, and punish enemies chasing an isolated flank.

- Keep pressure up through prolonged fights rather than trading all its health for an early damage spike.

- Help punish an enemy that overextends.

Why the lineup works

- **Two sources of forward destroyer pressure:** Gdańsk threatens with radar; Daring supplies close-range cap control. The team has options if one destroyer is forced away or loses health.
- **Layered detection:** Gdańsk and Petro can reveal targets while Ohio and the cruisers exploit the information.
- **Multiple firing angles:** Venezia creates mobile crossfire while Ohio, Petro, and Hindenburg pressure from different positions.
- **Push and withdrawal options:** Ohio and Napoli can anchor an advance; Venezia and Hindenburg can keep pressure from safer angles.
- **No automatic all-in:** the team does not need to commit every ship to the same close-range fight.

2. Replacement planning

Tier X seasons may impose ship limits, grouped restrictions, or outright bans. Restrictions have historically affected ships including Napoli, Petropavlovsk, Des Moines, Moskva, Småland, and Gdańsk. Check the current rules before finalizing the roster.

If unavailable	Possible replacement	Tactical adjustment
Ohio	Montana or another legal battleship suited to the map	Favor a stronger long-range or broadside-punishing role.
Gdańsk	Vampire II or Yueyang	Account for reduced radar pressure; make the cruiser's radar plan more important.
Daring	Vampire II or Marceau	Vampire II emphasizes cap control; Marceau emphasizes mobile gun pressure.
Petropavlovsk	Moskva, Des Moines, or Salem, subject to restrictions	Rework radar timing, firing position, and positional commitment.
Napoli	Hindenburg or Marseille, if legal	Expect less of Napoli's distinctive close-range toughness and smoke utility.
Venezia	Hindenburg or another mobile cruiser	Preserve a reliable crossfire and withdrawal plan.
Hindenburg	Des Moines or Salem for island control; another legal long-range cruiser on open maps	Adapt how the team holds positions and sustains pressure.

Roster rule: replace the missing *job*, not merely the missing ship. For example, another destroyer may scout and contest caps if Gdańsk is unavailable, but the team must deliberately compensate for the lost radar pressure.

3. General battle plan: from opening to endgame

Opening — Learn the enemy setup safely

- Use both destroyers to identify enemy positions and establish safe cap approaches.
- Do not send both destroyers into the same capture area.
- Keep Petro near a firing position that supports the primary cap.
- Hold Ohio where it can threaten more than one lane.
- **Objective:** discover the enemy setup without losing a destroyer or sacrificing substantial health for little gain.

Control — Choose and support an objective

- Select a primary cap and support it with destroyer vision, radar coverage, and cruiser fire.
- Use the second destroyer to screen a neighboring route or contest another objective without becoming isolated.
- Do not trade a destroyer for capture progress without a clear reason.
- Consider interrupting the enemy's capture attempt with detection and fire, then taking the objective after defensive consumables have been spent.

Damage — Make radar windows count

- Before radar is activated, the caller announces the likely target and focus.
- The destroyers and cruisers should be ready to shoot before the target is revealed.
- Once spotted, every ship with a realistic firing solution prioritizes the target.
- Do not use radar merely because an enemy might be nearby. Use it when the reveal can cause meaningful damage, force a retreat, or deny an objective.

Midgame — Build crossfires

- Arrange cruisers on different firing axes once enemy positions are understood.
- **Venezia:** seek a flank that forces enemy ships to turn.
- **Hindenburg:** maintain sustained pressure.
- **Petro:** hold the key threat zone.
- **Ohio:** punish exposed targets.
- Avoid placing every cruiser behind the same island or in the same firing lane. A one-direction formation lets enemies angle against most of the team.

Decision point — Push only with support

A coordinated advance becomes more attractive when:

- The enemy has lost a ship.
- A key enemy is low enough to finish.
- Important enemy radar or smoke is unavailable.
- The enemy formation has been split or cannot bring its guns to bear.

Do **not** push simply because Ohio or Napoli is healthy. Advance when allies can support the move and the enemy cannot punish it with concentrated crossfire.

Endgame — Convert the score into a win

- **When ahead on ships or points:**

  - Avoid unnecessary health trades.

  - Keep a ship spotting.

  - Preserve radar for a likely contest.

  - Make the enemy cross dangerous firing lanes to recover.

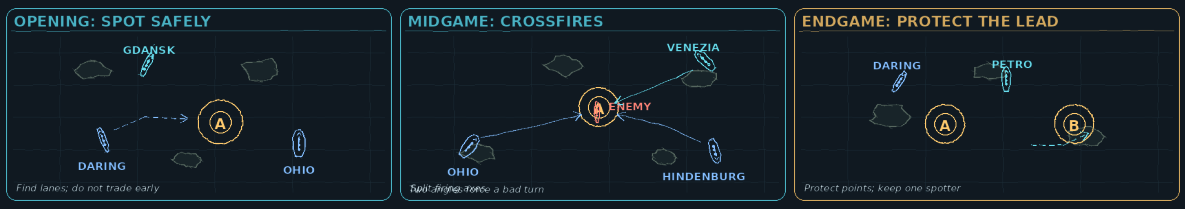

- **When behind:**

  - Rally around one achievable objective.

  - Isolate one enemy and concentrate fire to create a temporary numerical advantage.

  - Use torpedoes to constrain retreat routes where appropriate.

  - Do not feed ships into the enemy formation one at a time.

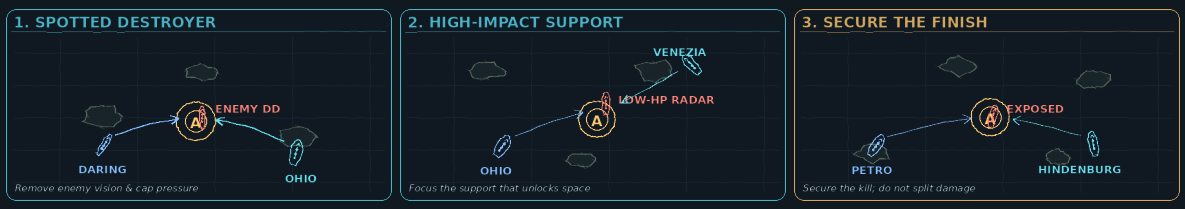

4. Target priority

Use this as a default decision order, not an inflexible rule:

1. **A spotted enemy destroyer that can be hit.** Removing enemy spotting and cap pressure can change the battle.
2. **A low-health radar cruiser or other high-impact support ship.** Removing detection and crossfire threats makes the next move safer.
3. **Any exposed ship that can be eliminated with the available salvoes.** Secure a kill rather than spreading damage across several targets.
4. **Battleships and other durable targets** when a finish is realistic or their presence blocks the next objective.

Override the list when necessary: a battleship showing a fatal broadside or a nearly dead cruiser about to escape may be the urgent target. Focus the ship whose removal creates the greatest immediate tactical advantage.

PART II — STRATEGY OPTION A: OFFENSIVE ASSAULT / PUSH

1. Purpose and win condition

Goal: take a neutral or enemy cap, establish a close-range threat, and eliminate opponents through local superiority and decisive kills.

- Take territory instead of relying on a long kite to reset capture progress later.
- Force the enemy to fight on unfavorable terms.
- Commit only when positioning, numbers, support, and consumables make the engagement favorable.
- A push is **not** a straight-line charge. Concealment, crossfire awareness, timing, and an exit route still matter.

Recommended seven-ship lineup

The original baseline ships are marked **(Original)**; additions for this strategy are marked **(New)**.

- **1. Schlieffen (New) — Primary brawler**

  - Secondaries, torpedoes, hydro, and speed create a dangerous close-range threat.

  - Its relatively small health pool and limited Repair Party charges make an unsupported early push costly.

  - Do not let an early salvo reveal the plan before support is ready.

- **2. Napoli (Original) — Secondary brawler**

  - High survivability, strong secondaries, and exhaust smoke support the close-range advance.

  - Use smoke for a planned engagement, reposition, or withdrawal—not as a substitute for an exit plan.

- **3. Gdańsk (Original) — Radar pressure**

  - Use radar to reveal an enemy destroyer when the team can concentrate fire.

  - Radar duration is short; target calls and allied readiness matter more than pressing the consumable on suspicion.

- **4. Daring (Original) — Cap fighter**

  - Screens the advance, contests the chosen cap, and adds a second torpedo threat.

  - Stay slightly ahead of or offset from the heavier ships, but within supporting gun range.

  - Provide early warning as well as objective control.

- **5. Marseille (New) — Mobile assault**

  - Speed, reload booster, and flanking pressure threaten enemies from a different angle.

  - Exploit a developing fight rather than being the first ship to reveal itself.

  - Shift into a firing position when enemies turn toward Schlieffen and Napoli.

- **6. Petropavlovsk (Original) — Radar support**

  - Supports the push from a protected angle rather than brawling alongside Schlieffen.

- Use radar and heavy AP to punish exposed or broadside targets.

- **7. Hindenburg (Original) — Sustained damage and torpedo threat**

- Supplies sustained gun pressure; hydro and torpedoes make confined approaches dangerous.

- Its detectability and limited speed mean it should not lead the advance.

2. Formation: two supporting groups

Group A — Objective assault

Schlieffen + Napoli + Daring

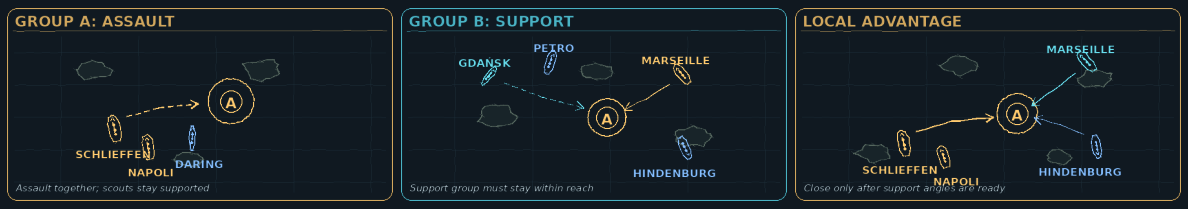

- Daring scouts and contests the route.
- Napoli advances through cover with Schlieffen.
- The two heavy ships should enter effective engagement range at roughly the same stage of the battle.

Group B — Fire support and crossfire

Gdańsk + Petropavlovsk + Marseille + Hindenburg

- Gdańsk and Petro provide radar pressure.
- Hindenburg supplies sustained damage.
- Marseille searches for an offset firing angle.
- This group should make it difficult for the enemy to focus all fire on the assault group.

Spacing rule: keep both groups close enough to support each other. An offset angle is useful; a gap that lets the enemy defeat one group before the other can intervene is not.

3. How to execute the push

Step 1 — Approach without revealing the plan

- Use islands, concealment, and map edges to mask the approach.
- Avoid firing at maximum range if it reveals Schlieffen before the team is ready.
- Gdańsk and Daring identify the opposition and report likely crossfire lanes.
- Keep the heavy ships outside the worst incoming firing angles until the enemy's support relationships are understood.

Step 2 — Force a reaction

- Use a radar window to threaten an enemy destroyer or discourage a cap contest.
- Meanwhile, Marseille and Hindenburg establish angles that punish enemies who turn toward Schlieffen.

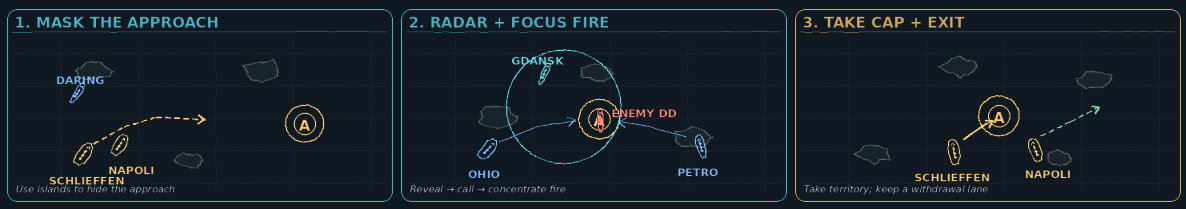

- Look for an isolated enemy, a spent defensive consumable, a low-health target, or a flank that cannot support the rest of the enemy team.

Step 3 — Commit to one objective

- Take a neutral or enemy cap and win the local fight.
- Focus the enemy destroyer or vulnerable support ship that can be killed; do not spread damage across all seven opponents.
- Schlieffen and Napoli move in when the support group can prevent the enemy from safely focusing them.
- Launch torpedoes to punish predictable retreats, deny a narrow approach, or finish an enemy—not as a reason to expose broadside to several guns.

Step 4 — Turn a local win into territory

- After gaining a ship advantage, secure the cap and pressure the next objective while the enemy reorganizes.
- Do not automatically fall back to kite and reset a cap you already own if a favorable fight can win another objective.
- Assign a ship to screen routes threatening existing caps; the other six can sustain pressure if the screen is adequate.
- If the enemy can win the point race by completing a capture, defending that cap takes priority over chasing kills.

4. Push checklist: green lights and red lights

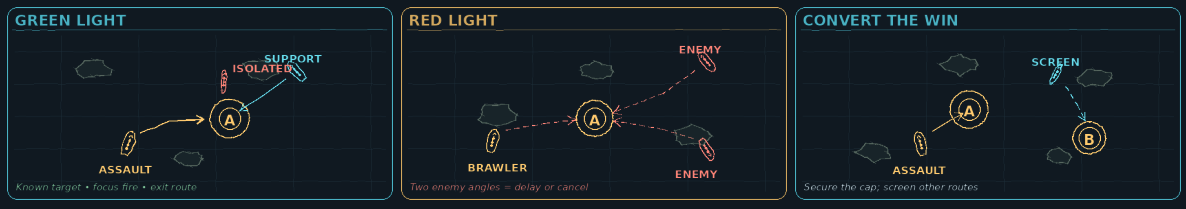

Green lights — Conditions that support a hard push

- The enemy destroyer is located, or its route is understood.
- The team can focus fire on one or more targets.
- The main enemy crossfire is masked, occupied, or otherwise manageable.
- The assault group has a viable exit route.

Red lights — Conditions to delay or cancel

- Schlieffen is spotted before its support is ready.
- Multiple enemy firing angles cover the approach.
- Friendly radar cannot be coordinated with allied guns.
- A forward ship is already too low on health to survive or be rescued.

Remember: the secondaries are not the problem; the timing is. Schlieffen and Napoli are most dangerous after the team sets up the engagement. Close-range weapons do not make them immune to crossfire or concentrated AP.

5. Offensive alternatives if ships are restricted

Missing ship	Practical replacement	Tactical trade-off
Schlieffen	St. Vincent or Ohio	St. Vincent retains torpedo threat and mobility; Ohio is more of a gun-and-sustain anchor. Neither duplicates Schlieffen's secondary-focused threat.
Napoli	Marseille or Hindenburg	Maintains pressure but loses Napoli's combination of survivability, secondaries, and exhaust smoke.
Gdańsk	Småland, if permitted, or Marceau	Småland offers a different destroyer-control package; Marceau emphasizes gun pressure, so another ship must cover the lost radar role.
Petropavlovsk	Moskva, Des Moines, or Alexander Nevsky, if permitted	Choose based on whether the team needs radar at range or protected island-based fire support.
Marseille	Venezia or Henri IV	Retains mobility and crossfire pressure with a different damage profile and defensive toolkit.

PART III — STRATEGY OPTION B: DEFENSIVE CONTROL / HOLD

1. Purpose and win condition

Goal: preserve ships, defend the territory that matters, reset enemy capture attempts, and win through positioning and capture-point pressure.

- You do not need to kill every enemy or own every cap at once.
- Preserve health long enough for positional advantage and points to decide the battle.

- Make opponents lose health whenever they try to change the situation.
- Reset enemies contesting an owned cap instead of chasing them into a poor position.
- Use concealment, long-range HE pressure, radar, island cover, and kiting mobility.
- If the score makes passive defense insufficient, shift to a limited counterattack with a clear target.

Recommended seven-ship lineup

- **1. Conqueror (New) — Long-range HE and fire pressure**

  - Long-range HE, high fire chance, and Specialized Repair Teams create sustained pressure.

  - The source notes a 24.25 km main-battery range and 48% base HE fire chance.

  - Its armor can suffer under sustained HE punishment; do not remain exposed in crossfire just because it can heal.

- **2. Daring (Original) — Cap defender**

  - Watches approaches to the controlled cap.

  - Spots when safe and contests only when support is available.

  - Preserve smoke and health when enemy radar or gunboats can punish the position.

- **3. Shimakaze (New) — Stealth screening**

  - Low detectability and torpedoes provide scouting and area denial.

  - Its information and the space enemies refuse to cross may be more valuable than damage.

  - Avoid opening fire on a target that cannot be finished if doing so sacrifices concealment.

- **4. Alexander Nevsky (New) — Long-range radar**

  - The source notes a 19.04 km gun range, radar, and rapid-firing guns.

  - Reveal targets when allied guns are ready to exploit the information.

  - Limited survivability and poor maneuverability make an exposed position dangerous.

- **5. Hindenburg (Original) — Sustained damage**

  - The source notes a 17.83 km range, rapid main battery, HE pressure, and hydro.

  - Apply HE pressure to battleships and cruisers; switch to AP against suitable broadside targets.

  - Use islands and kiting angles rather than trying to occupy Nevsky's exact position.

- **6. Henri IV (New) — Mobile kiter**

  - The source notes a 19.08 km range, high fire chance, speed boost, and reload booster.

  - Use range and speed to make incoming fire harder to land; reposition when the enemy builds a crossfire.

  - High detectability makes it better suited to distance and movement than to a close position with no escape route.

- **7. Zaō (New) — Stealth crossfire**

  - High accuracy, low detectability, and torpedoes threaten exposed ships from a concealed angle.

  - Go dark and reposition when enemies turn toward it.

  - Its small health pool makes concealment and crossfire awareness essential.

Battleship alternative

- **Montana can replace Conqueror** if the team prefers a more conventional, durable gun platform.
- The source notes a 23.65 km base main-battery range, enhanced Repair Party, and 36% base HE fire chance.
- This trades Conqueror's stronger HE fire pressure and repair profile for a different defensive package.

2. Defensive positioning: hold important territory, not every lane

Position A — Main cap defense

Daring + Alexander Nevsky + Hindenburg

- Daring gathers information and contests safe approaches.
- Nevsky supplies long-range fire support and radar.
- Hindenburg occupies a separate position to punish ships maneuvering toward the cap.

Position B — Range and crossfire

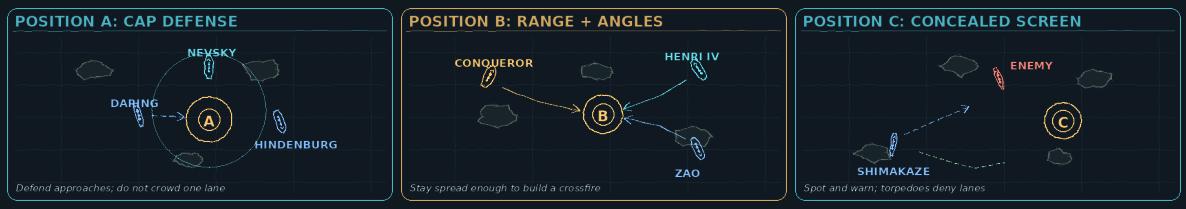

Conqueror + Henri IV + Zaō

- Keep these ships at different angles to the main fight.
- Prefer a route behind an island or terrain boundary.
- Make enemies turn, lose health, and give up favorable positioning rather than driving directly into their formation.

Position C — Concealed screen

Shimakaze

- Spots enemy movements, threatens torpedo lanes, and warns of flanking attempts.
- Do not force it to fight an enemy gunboat merely to maintain vision if losing it would remove the team's forward information.

3. How to execute the hold

Step 1 — Choose a defensible two-cap plan

- Assign two ships to protect the primary cap and its approaches.
- Keep the rest of the team in a support formation that can reach both important objectives.
- Do not push deep into the third cap just because it is not yours.
- Use islands to block at least one enemy firing axis where possible.
- Keep enough separation for crossfires, but not so much that an enemy can isolate one ship.

Step 2 — Preserve concealment and fire from chosen positions

- Shimakaze and Daring provide forward vision.
- Cruisers should fire from positions that reach targets without exposing their broadside to a second enemy angle.
- Nevsky should use its range to create radar opportunities while avoiding an open-water position where the whole enemy team can shoot it.
- Main-battery fire can increase a ship's sea detectability to its gun range for up to 20 seconds when enemies can spot it. Breaking line of sight behind an island can end exposure sooner.
- Plan a cover route **before** firing, not after return fire begins.

Step 3 — Reset an enemy capture attempt

- If an enemy destroyer or cruiser enters a cap you control, prioritize revealing and damaging that ship.
- Use radar when several allied ships can shoot the target.
- If it retreats, secure the cap instead of chasing it around an island.
- Prefer a low-cost reset from protected positions over sacrificing multiple cruisers to stop one capture attempt.

Step 4 — Kite when the enemy commits

- When several enemies focus one cruiser, disengage along its preplanned route while maintaining a firing angle if possible.
- **Henri IV:** use speed and distance.
- **Zaō:** use concealment to go dark.
- **Hindenburg:** use island cover and hydro to protect the retreat.
- Do not have every ship retreat in the same direction and expose broadside to the same enemy.
- One ship can kite while another holds a protected island position, preserving overlapping fire.

Step 5 — Let points force the opponent to act

- Once the team controls the necessary objectives, do not advance just to seek damage.
- Use HE to start fires, punish approaches, and force Damage Control Party use.
- Keep a destroyer spotting so the team can switch targets when an enemy becomes vulnerable.
- If ahead on ships and points, maintain safe control.
- If the enemy's points lead is too large to overcome by waiting, launch a limited counterattack against a clear local target.

4. Defensive alternatives and map adjustments

Situation	Recommended change	Why
Conqueror unavailable or too vulnerable	Montana	More conventional battleship defense and strong broadside punishment.
Nevsky banned or restricted	Moskva or Petropavlovsk, if permitted	Retains radar-based objective control with different range and positioning trade-offs.
Shimakaze cannot safely screen	Yueyang or another suitable concealment-oriented destroyer	Adapts the scouting role to the available ship pool.
Map has excellent island firing positions	Des Moines can replace Zaō or Henri IV	Strong sustained fire and utility from cover, but less open-water range.
Map is very open	Yoshino can replace Zaō or Des Moines	The source notes a 21.29 km main-battery range and torpedo threat; maneuverability makes escape planning important.

Map note: Des Moines is especially useful when terrain protects its hull while allowing fire onto an approaching cap. Its high main-battery DPM is offset by the source-noted 15.83 km range, so it is not the default choice for open-water kiting.

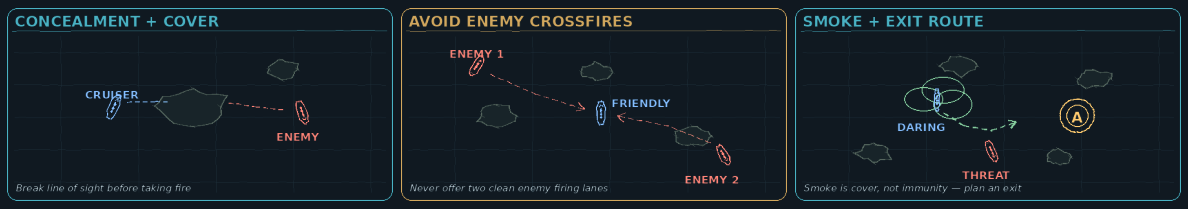

REFERENCE — RULES THAT APPLY TO BOTH STRATEGIES

Mandatory concealment and crossfire rules

5. **Know the likely return fire before exposing a ship.**
   - Before opening fire, each cruiser should know which enemies can shoot it.
   - Identify where to go if two or more opponents turn their guns toward you.
6. **Use spotting to create a shooting advantage—not just information.**
   - Radar is valuable when the team can exploit the reveal.
   - A concealed destroyer spotting a weak flank may be more useful than one that fires and loses its spotting advantage.
7. **Create your own crossfires without entering two enemy crossfires.**
   - Friendly ships should use different firing angles.
   - Each ship should avoid a position where two enemy groups can hit it at once.
   - Use islands, concealment, and deliberate spacing to limit incoming guns.
8. **Treat smoke as cover, not immunity.**

- Smoke can also hide enemy ships from your team.
- Radar, hydro, close-range detection, and torpedoes can still threaten a smoke position.
- Every smoke deployment needs a detection plan and an exit route.

9. **Do not trade health for damage that does not advance the win condition.**
   - A battleship with 40,000 HP and a useful Repair Party remaining can still shape the battle.
   - More damage dealt is not worth becoming too weak to defend or contest a decisive objective.
10. **Neither defend a cap at any cost nor abandon it for damage.**
    - Decide based on score, remaining time, ship count, and whether the enemy capture can change the outcome.

REFERENCE — FINAL DECISION: PUSH OR HOLD?

Direct comparison: offensive push vs. defensive hold

This is the **specific strategic comparison** between the offensive assault and defensive control plans. It is different from the general opening-to-endgame framework in Part I: the general framework describes how the team operates; this table helps decide **which win condition to pursue**.

Decision factor	OFFENSIVE PUSH — Take territory and finish ships	DEFENSIVE HOLD — Preserve territory and win on points
Primary win condition	Capture enemy territory and eliminate ships.	Preserve owned caps and win through points.
Preferred engagement	Close-range fight with a local advantage.	Longer-range fight with a planned escape route.
Health philosophy	Spend health when it secures kills and territory.	Preserve health unless a decisive reset or counterattack requires a trade.
First priority	Remove enemy spotting or support threats blocking the advance.	Prevent enemy spotting and resets from overturning your cap advantage.
Radar usage	Reveal a target for an immediate focus-fire window.	Reveal a capper without exposing the defending team.
Torpedo use	Finish or trap ships during an advancing fight.	Deny approaches and punish predictable pushes.
Main risk	Overcommitting into crossfire before support is ready.	Passive damage farming that fails to stop a dangerous cap or points deficit.

Decision factor	OFFENSIVE PUSH — Take territory and finish ships	DEFENSIVE HOLD — Preserve territory and win on points
Best situation	Enemy positions are weak, isolated, or forced to retreat.	Your team has defensible caps and can make the enemy approach.
Avoid when	The enemy has a strong overlapping firing line and can focus the push.	The enemy has a points lead so large that an active counterattack is necessary.

Quick decision guide

Choose the push when:

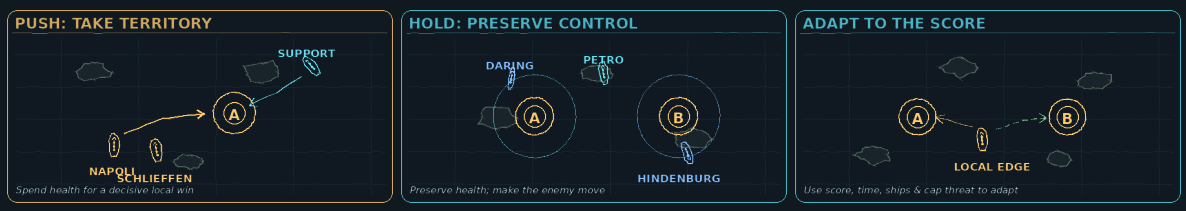

- A local numerical or positional advantage exists.
- Enemy ships are isolated, low, or unable to support each other.
- Radar and focus fire can create a kill window.
- The assault group can advance without being trapped in overlapping crossfire.
- A successful fight can secure a cap or materially improve the point race.

Choose the hold when:

- Your team already controls the objectives needed to win.
- Your ships have safe firing positions and planned retreat routes.
- The enemy must cross exposed water or give up territory to contest.
- You can reset captures without sacrificing ships.
- Your lead can be protected by spotting, disciplined damage, and patience.

Change plans when:

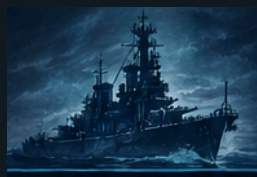

- The score makes the current plan insufficient.
- A key ship is lost or a critical role is no longer covered.
- The enemy's formation, consumables, or positioning changes the engagement.
- A cap is about to decide the battle and demands immediate action.

The final rule

General strategy is the team's operating system; push or hold is the match-specific win condition. Scout safely, coordinate radar, focus fire, build crossfires, preserve escape routes, and adapt to the score. Then push when a favorable local fight can win territory—or hold when disciplined positioning can make the enemy lose the point race.

TIER X CLAN BATTLES

COMPETITIVE RESEARCH & WINNING TEAM STRATEGY

VISION • RADAR • CROSSFIRES • COORDINATION • VICTORY

It's not about the best ships.
It's about the right ships,
working together, for the right job."

TABLE OF CONTENTS

Part I – General Team Strategy

   4. Forcing Enemy Mistakes 15

Shared Tactical Rules 16
Push vs. Hold Strategy Comparison 17
Recommended Ship Composition 18

Click a section above to jump to the page.

Page numbers are approximate.

Part I – General Team Strategy

The foundation for every battle.

1. Vision & Information

- Find enemy positions early.
- Keep the map open.
- Share information with the team.

2. Overlapping Radar

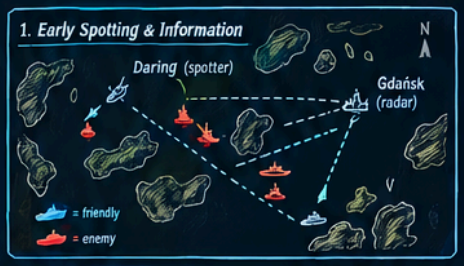

- Coordinate radar coverage.
- Create detection traps.
- Keep guns ready.

3. Crossfires & Focus Fire

- Avoid firing from the same angle.
- Create crossfires.
- Eliminate targets quickly.

4. Caps, Health & Endgame

- Contest and reset caps.
- Manage ship health and positioning.
- Plan for the final push or defense.

Part II – Offensive Assault (Push)

Create a local advantage and take territory.

1. Assault Group & Support Group

- Lead with the right ships.
- Keep supporting fire.
- Maintain spacing and angles.

2. Timing & Commitment

- Strike when the enemy is vulnerable.
- Avoid overextending.
- Commit as a team.

3. Focus Fire & Kills

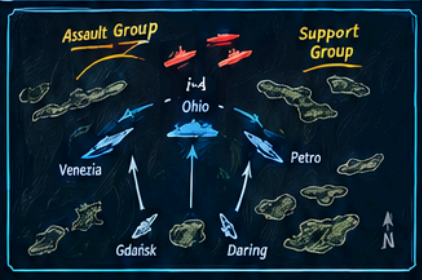

- Eliminate key targets first.
- Use radar and spotting.
- Maintain fire discipline.

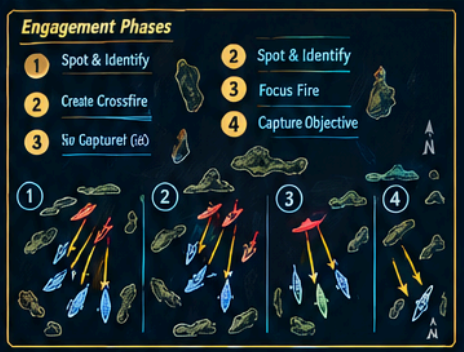

4. Objective Capture

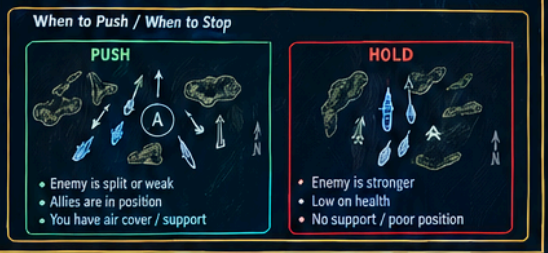

- Secure the cap.
- Hold until support arrives.
- Avoid getting isolated.

5. When to Push / When to Stop

- Push on advantage.
- Stop if outnumbered or low on health.
- Regroup and reset.

Part III – Defensive Control (Hold)

Preserve ships, control territory, and manage the point race.

1. Key Caps & Reset

- Hold important objectives.
- Reset enemy captures.
- Use smoke and hydro.

2. Safe Firing Positions

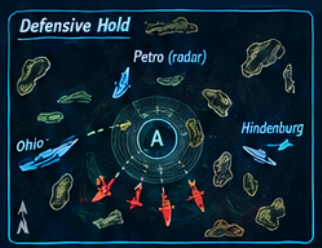

- Maintain range and cover.
- Keep an escape route.
- Avoid unnecessary risks.

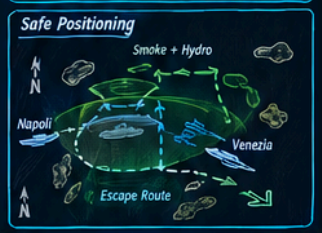

3. Escape Routes

- Plan your retreat.
- Keep mobility options open.
- Avoid getting trapped.

4. Forcing Enemy Mistakes

- Bait overextensions.
- Use radar and information.
- Punish poor positioning.

Shared Tactical Rules

Stay Together	Use Radar Wisely	Manage Resources	Communicate	Adapt
Keep your ships in range.	Call targets before firing.	Smoke, hydro, and HP are limited.	Share info. Call shots. Stay calm.	Adjust to the enemy and the situation.

Push vs. Hold Strategy Comparison

Factor	Push (Offensive)	Hold (Defensive)
Health Philosophy	Use health to gain ground	Preserve health for later
Engagement Range	Close to medium	Medium to long
Radar Use	Create attack windows	Protect key areas
Torpedo Use	Limited / situational	Defensive / area denial
Risk Level	High	Lower
Ideal Situation	Enemy is weak or split	Enemy is stronger or holding

Recommended Ship Composition

- Ohio (BB) – Fire support / punishment
- Gdańsk (DD) – Radar / enemy pressure
- Daring (DD) – Cap control / close range
- Petropavlovsk (CA) – Radar / cruiser control
- Napoli (CA) – Close range support
- Venezia (CA) – Mobile crossfire / SAP
- Hindenburg (CA) – Sustained damage / kiting

★ This composition gives you vision, radar, crossfires, cap control, and both the ability to push and the ability to leave. If you replace a ship, keep its role.

THE RIGHT SHIPS + THE RIGHT ROLES = VICTORY
